Grace Jin

San Jose, CA | (408) 750-7200 | gsj33@cornell.edu | gracejin.dev | github.com/gracejinsotrue | linkedin.com/in/grace-jin-cornell

EDUCATION

Cornell University, College of Engineering — Expected December 2027
Master of Engineering, Computer Science

Cornell University, College of Engineering — Expected May 2027
B.S. Computer Science, Minor in Artificial Intelligence

- **Relevant Coursework:** Systems Programming, Compiler Design, Operating Systems, Physically Based Rendering, Computer Graphics, Machine Learning, Data Structures and Algorithms, Digital Logic and Computer Organization
- **Leadership:** Cornell XR (Extended Reality) Project Team Co-Founder, Space Systems Design Studio Software Lead

EXPERIENCE

LinkedIn | Software Engineering Intern, Mountain View, CA — May 2026 – Aug. 2026

- Systems Infrastructure team; built an autonomous LLM-agent autofixer that rewrites blocking I/O into async equivalents across 50+ production Python services, cutting per-request blocked thread time by 97%
- Owned design and implementation of the autofixer's core orchestration pipeline for deterministic validation tooling with deepagents into a LangGraph pipeline that shipped 100% traceable production pull requests at an 85% merge rate
- Built automated CI/CD pipelines and test runners utilizing fault-injection and AST assertion diffing to prevent regressions in production, catching 88% of broken LLM fixes at a 5% false-block rate

Cepton Technologies | Software Engineering Intern, San Jose, CA — May 2025 – Aug. 2025

- Graphics Perception Team; built a real-time WGPU 3D simulation pipeline on Linux systems to simulate LiDAR data rendered over synthetic autonomous vehicles at 60+ FPS
- Wrote WGSL compute shaders that composite real and synthetic LiDAR returns per ray, generating 3600+ labeled frames of ML model training data per simulation run
- Built a 3D environment reconstruction system in Rust to generate simulator depth maps integrated within GPU pipeline
- Replaced legacy Rust transformations with library-backed matrix kernels (SVD, affine), reducing compute time by 40%
- Authored engineering blog post documenting this project: developer.cepton.com/blog/AR_simulator

People and Robots Teaching and Learning (PoRTaL) | Software Developer, Ithaca, NY — Aug. 2024 – May 2025

- Wrote the simulation backend computing valid actions and state transitions for an autonomous LLM agent, plus a PyGame interface compiling object placement into thousand-line JSON task specs across 250+ scene configurations
- Implemented 25+ sync and async planning tasks to test agent reasoning over parallel dependencies and time delays

PROJECTS

Physically-Based Ray Tracer [GitHub] | C++, DirectX, HLSL, DXR, Intel Open Image Denoise — Jan. 2026 – Present

- Build a GPU-accelerated path tracer with 32-bounce GI, fiber BCSDF, Disney BSDF, subsurface scattering, null-collision volumetrics, HDR environment lighting, and balance-heuristic MIS capable of rendering 10M+ triangles
- Cut GPU frame time up to 15× by porting the renderer to DXR inline ray tracing, eliminating shader-dispatch overhead
- Accelerate volume rendering with majorant-mip empty-space skipping and analytic fast-path on constant extinction
- Profile GPU bottlenecks with Nsight Graphics and a custom GPU-timestamp harness; shrink the ray payload by 65%

CUDA Graphics Rasterizer Engine [GitHub] | C++, CUDA, SDL2 — Jul. 2025 – Present

- Build a real-time 3D renderer implementing the full graphics pipeline as custom CUDA kernels with no graphics API
- Replace an O(pixels × triangles) kernel with tile binning over a CUB prefix-sum scatter: 101.7 → 7.9 ms/frame
- Fuse backface and frustum culling into the vertex transform kernel with atomic stream compaction, rejecting 78% of triangles before the binning stage

Eta Language Compiler in C++ [GitHub] | C++, Bison, x86, Docker — Jan. 2026 – May 2026

- Built an end-to-end compiler for a C-like statically-typed language, spanning lexical analysis, parsing, type checking, IR lowering, x86-64 code generation, and optimizations by leading a team of 4
- Slashed benchmark runtime by 60% and instruction count by 35% by coupling an SSA optimization framework with a maximal-munch x86-64 instruction selector designed to exploit hardware addressing modes and cache locality

Computer Science Content Creator [Instagram] — Aug. 2019 – Present

- Build an audience of 20K+ followers and 3M+ video views by posting computing topics, personal projects and digital art

SKILLS

Programming Languages: C++, Python, Java, Rust, Javascript/Typescript, SQL
GPU Computing & Graphics: CUDA, DirectX, HLSL, WGPU/WebGPU, OpenGL/WebGL, Nsight Graphics, Nsight Compute
Infrastructure and Tooling: Linux, WSL, Git, Docker, Kubernetes, CMake, Protocol Buffers (protobuf), RPC Systems
Development Tools: CI/CD Pipelines, PyTest, Unit Testing, Integration Testing, Regression Testing, Fault-Injection
